MAMMOGRAM REPORT

Clinical History:

34-year-old female presenting for evaluation of the left breast. Patient presented with a palpable lump noticed over the preceding weeks.

Technique:

Standard bilateral craniocaudal (CC) and mediolateral oblique (MLO) views were obtained and compared with prior imaging where available.

Findings:

An irregular, spiculated mass is noted in the left breast, upper outer quadrant, measuring approximately 1.6 cm in maximum dimension. Associated architectural distortion is present. No suspicious findings are seen in the contralateral breast. Skin and nipple appear unremarkable. No pathologic axillary lymphadenopathy is definitively seen on mammography.

Assessment / Impression:

Findings are suspicious for malignancy in the left breast.

BI-RADS Category: 4B

Recommendation:

Core needle biopsy recommended for tissue diagnosis.

Radiologist: Dr. P. Bose Electronically signed and verified.
